```

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, memanatopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                           The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019310) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Claim 20; SEQ ID NO 25074; 1399pp + Sequence Listing; English.

                                                                                                                                                                                                                                 The sequence is that of the mouse RelB protein, the DNA binding region of which may be mutated by replacing one or more amino acids. This allows inhibition, prevention or control of DNA binding and thus activation of genes controlled by the protein can be controlled.
                                                                                                                                                                                                                                                                                                                        Gaps

```
The invention relates to isolated polynucleotide (1) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorbatide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in temporatics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                       ö
                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention siscloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABL01840-ABL16175) and the encoded proteins where the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ttp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000\ \mathrm{or} more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Patent No. 6130367

Patent No. 6130367

Patent No. 6130367

APPLICANT: Springer, Franziska

APPLICANT: Abel, Gernot

TITLE OF INVENTION: DNA MOLECULES THAT CODE FOR ENZYMES

TITLE OF INVENTION: INVOLVED IN STARCH SYNTHESIS VECTORS BACTERIA TRANSGENIC

TITLE OF INVENTION: PLANT CELLS AND PLANTS CONTAINING SAID MOLECULES

NUMBER OF SEQUENCES: 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Patent No. 5679782
GENERAL IMPORMATION:
APPLICANT: Rosenberg, Steven
APPLICANT: Doyle, Michael
APPLICANT: Goodson, Robert
TITLE OF INVENTION: Peptide Inhibitors of Urokinase Receptor
TITLE OF INVENTION: Activity
NUMBER OF SEQUENCES: 37
CORRESPONDENCE ADDRESS:

A Status: preliminary; nucleic acid sequence not; shown; translation not shown A; Molecule type: DNA
A; Residues: 1-253 < AQFA
B; Reperimental source: strain VF5
C; Genetics: 1
C; Genetics: 1
C; Superfamily: inner membrane protein malk; ATP-binding cassette homology
C; Reywords: ATP; nucleotide binding; P-loop
C; Reywords: ATP; nucleotide binding motif A (P-loop)
F; 37-44/Region: nucleotide-binding motif A (P-loop)

Submitted (OCT-1995) to the EMBL/Genbank/DbbJ databases.

-I-CATALYTIC ACTIVITY: Hydrolysis of terminal non-reducing alpha-L-arabinofuranoside residues in alpha-L-arabinosides.

-I-CATALYTIC ACTIVITY: HYDROLYSIS OF 1,4-BETA-D-XYLANS SO AS TO REMOVE SUCCESSIVE D-XYLOSE RESIDUES FROM THE NON-REDUCING TERMINI. IT ALSO HYDROLYSES XYLOBIOSE.

-I-SIMILARITY: BELONGS TO FAMILY 54 OF GIYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Dobrzanski P., Ryseck R.P., Bravo R.;

-!- FUNCATION: CYTOCHROME C6 IS A MONDHERM MONOMER. IT FUNCTIONS AS AN ELECTRON CRARER BETWEEN MEMBRANE-BOUND CYTOCHROME F AND P700 IN THE PHOTOPHOSPHORYLATION CHAIN IN CHLOROPLASTS AND ALGAE. IT SUBSTITUTIES FOR PLASTOCYARIN IN COPPER-DEFICIENT BLUE-GREEN ALGAE AND IN THE CHLOROPLASTS OF SOME ENGRAROTE ALGAS.

-!- SUBCELLULAR LOCATION: Chloroplast; within the thylakoid lumen.
                                                                                                                   Reith M.E., Munholland J.; ^{\prime} "Complete nucleotide sequence of the Porphyra purpurea chloroplast

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is murine heparan sulphate 3-0-sulphotransferase (3-0ST)-3B. A substantially pure polysaccharide preparation enriched for 3-0ST-3 modified glucosamine residues is useful for inhibiting hexpes simplex virus type-1 (HSV-1) infection in a mammal. It is useful for inhibiting viral penetration and entry of HSV-1 into mammalian cells through heparan sulphate binding.
                                                                                                                                                                                                                                                                                                                                                            Mouse, 3.0ST-3B; heparan sulphate 3-0-sulphotransferase 3B; antiviral; herpes simplex virus type-1; HSV-1; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel pharmaceutical preparation useful for inhibiting herpes simplex virus type-1 infection in a mammal, comprises a polysaccharide preparation enriched for 3-0-sulfated glycosamine residues

AAD16606-AAD16627 represent cDNAs corresponding to human lipid metabolism protein genes, and AAE09639-AAE09660 represent the proteins they encode. AAD16628-AAD16642 represent human lipid metabolism genomic DNAs. The genes and their corresponding proteins are useful for preventing, treating or ameliorating medical conditions such as immune disorders, trilanmatory disorders (e.g., conjunctivitis, glossitis), autoimmune diseases (e.g., rheumatoid arthritis, systemic lupus erythematosus), respliatory disorders (asthma, allergy), CNS disorders (e.g., Alzheinmer's disorders (e.g., atheroscalerosis, coronary disease), hyperlipidaemia, hypolipidaemia, lipidoses, familial hypercholesterolaemia, Gaucher's disease, Tay-sach's disease, diabetes mellitus, cancer and other enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated lipid metabolism polypeptide for screening to identify antagonists and agonists that may enhance or block activities mediated by lipid metabolism proteins and also for testing and detection e.g. diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel nucleic acids and polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to these polypeptides. The polynucleotides are especially useful in the diagnosis, prognosis, prevention and/or treatment of diseases which include kidney disorders (e.g. renal failure or nephritis), cardiovascular disorders (e.g. pypertnasion or mycoardial infarction), blood disorders (e.g. pypertnasion or mycoardial infarction), electrolyte imbalance disorders (e.g. hyponatraemia or hyperkalaemia), neoplastic disorders (e.g. nephtoma or renal cell cancer), autoimmune disorders, endocrine disorders, neural activity and neurological disorders, wound haling and respiratory disorders, AAUIS64/AAUIS015 represent the novel human renal and cardiovascular-associated amino acid sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in the published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; antiinflammatory; neuroprotective; immunomodulator; vulnerary; cardiovascular; cytostatic; nephrotropic; antianaemic; nephritis; immunosuppressive; kidney disorder; renal failure; hypertension; cardiovascular disorder; my disorder; infarction; blood disorder; anaemia; blood cagulation disorder; electrolyte imbalance disorder; cancer; hyperaraemia; hyperalaemia; neoplastic disorder; nephroma, autoimmune disease; inflammatory disease; reproductive system disorder; endocrine disorder; neural activity; neurological disorder;
                                                                                                                                                                                                                                                                                                                                         New polynucleotides and polypeptides, useful for diagnosing, treating, preventing or prognosing e.g. kidney, cardiovascular, blood, electrolyte imbalance or neoplastic disorders, autoimmune diseases, cancers

The invention relates to novel nucleic acids and polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to these polypeptides. The polynucleotides are especially useful in the diagnosis, prognosis, prevention and/or treatment of diseases which include kidney disorders (e.g. renal failure or nephritis).

Cardiovascular disorders (e.g. hypertension or myocardial infarction), clood disorders (e.g. namemia or blood coagulation disorders), electrolyte imbalance disorders (e.g. hyponatraemia or hyperkalaemia), neoplastic disorders (e.g. nephroma or renal cell cancer), autoimmune diseases, cancers, inflammatory diseases, reproductive system disorders, wound healing and respiratory disorders. Anul8644-AAU1875 represent the novel human renal and cardiovascular-associated amino acid sequences of the invention. Note: The sequence data for this patent discrime part of the printed specification, but was obtained in electronic format directly from MPO at:
                                                                                                                   New polynucleotides and polypeptides, useful for diagnosing, treating, preventing or prognosing e.g. kidney, cardiovascular, blood, electrolyte imbalance or neoplastic disorders, autoimmune diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; primer; detection; diagnosis; antisense therapy; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Saito K, Yamamoto J;

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification, Where a primer set full-length cDNAs defined in the specification, where a primer set to the complementary strand of a polynucleotide which comprises one of the S602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide which comprises a 5'-end complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end polynucleotide which comprises a 3'-end sequence complementary to the polynucleotide comprises a 3'-end sequence complementary to the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the full sequence/3'-end sequence is selected from those defined in the full depth cDNAs. The primers are useful for synthesising polynucleotides, the full-length cDNAs. The primers also useful for the connection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs represent human cDNA sequences; AAB92446 to AAH13629 to AAH13629 to AAH13622 represent human amino acid sequences; and AAH13629 to AAH13620 constant of the full-length cDNA conservation and a sequences; and AAH13620 to AAH13620 conservation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                     Primer sets for synthesizing polynucleotides, particularly the 5602 full-length DNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length CDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The invention relates to human polynucleotides (AAI79941-AAI9841) and the encoded proteins (AA000010-AA019910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, haematopolesis regulating activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electrodic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bacillus subtilis; single-strand binding protein;
helix-destabilising protein; Rattus norvegicus; Eubacterium;
ssDNA binding protein; treatment; prevention; bacterial infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid from Staphylococcus aureus NCIMB 40771 - useful
for, e.g. diagnosis, prevention and treatment of bacterial
infection(s)
                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing liagnosing and treating e.g. leukaemia, inflammation and immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

                       AAW79358-59 represent Staphylococcus aureus WCHU (NCIMB 40771) proteins that have homology to a Bacillius subtilis single-strand binding protein (helix-destabilising protein) (AAW79358) and a Rattus norvegicus and a Eubacterium ssDNA binding protein (AAW79359). The protein is used to generate antibodies and to screen for antimicrobials. The products are used to treat or prevent becterial infections, particularly where caused by S. aureus but also against Helicobacter pylori. Particular applications are to treat subjects before surgery or insertion of an in-dwelling device (alternatively the device itself is impregnated before placement). The nucleic acid sequence is used as sources of antisense sequences (for therapeutic use) or requiatory elements for controlling expression of bacterial genes, and for antibacterial screening. The protein can be also used as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The plasmid pHD5HT2f comprises the sequence AAQ49781 which codes for novel serotonin receptor. Fragments of the full-length coding region are disclosed as suitable for use as probes to find homologous (receptor) sequences. The preferred fragments are those coding for the G-loop, the N-terminal and the C-terminal of the 5-HT2f receptor (AAR41943-R41945, respectively).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                5-hydroxytryptamine; receptor; serotoninergic; vasoconstriction; plasmid pHD5HT2f; probe.

AAW79358-59 represent Staphylococcus aureus WCHU (NCIMB 40771) proteins that have homology to a Bacillus subtils single-strand binding protein (helix-destabilising protein) (AAW79358) and a Ratus norvegicus and a Eubacterium ssDNA binding protein (AAW79359). The protein is used to generate antibodies and to screen for antimicrobials. The products are used to treat or prevent bacterial infections, particularly where caused by S. aureus but also against Helicobacter pylori. Particular applications are to treat subjects before surgery or insertion of an in-dwelling device (alternatively the device itself is impregnated before placement). The nucleic acid sequence is used as sources of antisones sequences (for therapeutic use) or requilatory elements for controlling expression of bacterial genes, and for antibacterial screening. The protein can be also used as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antiblotics, the essential genes themselves and the encoded proteins. The prokaryotes used are sentential experienced sureus, Salmonella typhi, Riebsiella premoriae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the interococcus faecalis. The invention is also useful for the interococcus faecalis. The invention is also useful for the interococcus faecalis. The proteins useful proliferation, to express these proteins, to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The autisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

Co fine printed specification, but was obtained in electronic format directly from WIPO at contined in electronic format directly from WIPO at the wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ohlsen KL, Zyskind JW, Wall D, Trawick JD, Carr GJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coll, Staphylococcus aureus, Salmonella typhi, (Hebstella pneumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at form will be proved the content of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are such an ord, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facealis. The subtomonia, the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to obtain antibodies capable of binding to the expressed proteins. The profile acid sequence is also useful to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a sesential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part for the printed specification, but was obtained in electronic format directly from WIPO at the vipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ohlsen KL, Zyskind JW, Wall D, Trawick JD, Carr GJ;
